React JS Lesson 19 – Nested Routing (Premium Notes)

1) What is Nested Routing

- Nested routing means route inside another route.
- Used when child pages belong to one main section.

Example:

/products/men
/products/women

Explanation:

- Both pages stay under products route.

2) Parent Route vs Child Routes

- Parent route holds common layout.
- Child routes change inside parent.

Example:

Parent → /products
Child → men , women

Explanation:

- Parent stays same while child content changes.

3) Creating Nested Routes using children

- children array creates nested routes.

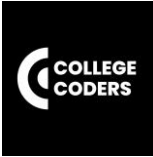

Example:

```
<Route path='products' element={<Products />}>  
  <Route path='men' element={<Men />} />  
  <Route path='women' element={<Women />} />  
</Route>
```

Explanation:

- Child routes live inside parent route.

4) Understanding Outlet

COLLEGE CODERS

- Outlet displays child component inside parent component.

Example:

```
<Outlet />
```

Explanation:

- Without Outlet child page will not appear.

5) Navigation inside Nested Routes

- Use Link for child routes.

Example:

```
<Link to='men'>Men</Link>
<Link to='women'>Women</Link>
```

Explanation:

- Relative links stay inside parent route.

6) Relative Paths (men / women)

- No need full /products/men path inside parent.

Example:

```
to='men'
```

Explanation:

- React joins parent path automatically.

7) Building Men's Collection Page

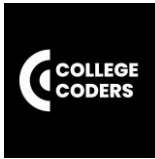

- Create Men component and route.

Example:

```
function Men(){
  return <h2>Men Collection</h2>
}
```

Explanation:

- Men page loads inside Outlet.

COLLEGE CODERS

8) Building Women's Collection Page

- Create Women component similarly.

Example:

```
function Women(){  
  return <h2>Women Collection</h2>  
}
```

Explanation:

- Women page also loads inside Outlet.

9) How Nested Routing works internally

- Parent renders first.
- Outlet injects matching child.

Example:

Parent → Outlet → Child

Explanation:

- React Router matches route step by step.

10) Real-world use case (Category-based pages)

- E-commerce categories
- Dashboard sections
- Admin panels

Example:

```
/dashboard/users  
/dashboard/orders
```

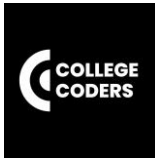

Explanation:

- Nested routing is heavily used in real projects.

Mini Project – Product Categories

Products page → Men / Women child pages

- Create Products parent page.

COLLEGE CODERS

- Add Men and Women child routes.
- Use Outlet for rendering.
