React JS Lesson 21 – Protected Routes (Premium Notes)

1) What are Protected Routes

- Protected routes allow only authorized users to access certain pages.
- Unauthorized users are blocked.

Example:

Protected → /home , /products

Explanation:

- Only logged-in users can enter.

2) Why we use Protected Routes

- Used for login-based access control.
- Important for dashboards, admin pages, profile pages.

Example:

Login required before access

Explanation:

- Security improves.

3) Creating a ProtectedRoute wrapper component

- Wrapper checks auth before rendering child page.

Example:

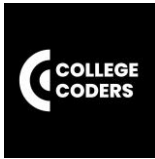

```
function ProtectedRoute({isAuth, children}){  
  return isAuth ? children : <Navigate to='/' />  
}
```

Explanation:

- If auth true → page shown.
- Else redirect login.

4) Managing login state using useState

- Auth state tracks login status.

COLLEGE CODERS

Example:

```
const [isAuth,setIsAuth] = useState(false);
```

Explanation:

- false means not logged in.

5) Using Navigate for automatic redirects

- Navigate redirects instantly when auth fails.

Example:

```
<Navigate to='/' />
```

Explanation:

- User sent to login page.

6) Protecting multiple routes like /home and /products

- Same wrapper can protect many pages.

Example:

```
<Route path='/home' element={
  <ProtectedRoute isAuth={isAuth}>
    <Home />
  </ProtectedRoute>
} />
```

Explanation:

- Reusable protection logic.

7) Redirecting unauthorized users to Login page

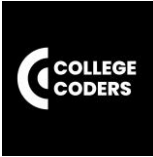

- Unauthorized user automatically returns login.

Example:

isAuth false → login page

Explanation:

- No protected access allowed.

COLLEGE CODERS

8) Updating auth state after login and navigating to products

- After successful login update auth then navigate.

Example:

```
setIsAuth(true);  
navigate('/products');
```

Explanation:

- Login success opens products page.

Mini Project – Login Protected Products Page

Login → auth true → products page

- Create login page.
- Protect home and products.
- Redirect unauthorized users.
