React JS Lesson 6 – Event Handling (Premium Notes)

1) What is an Event?

- An event is an action performed by user inside browser.
- Examples: click, typing, submit, hover.

Example:

Button click, typing inside input, submitting form

Explanation:

- All user actions are events.

2) What is Event Handling in React?

- Event handling means responding to user actions using functions.

Example:

```
<button onClick={handleClick}>Click</button>
```

Explanation:

- React connects event to function.

3) onClick Event – Handling Button Clicks

- onClick runs function when button is clicked.

Example:

```
function handleClick(){  
  alert("Button Clicked");  
}
```

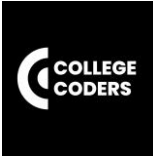

```
<button onClick={handleClick}>Click Me</button>
```

Explanation:

- handleClick executes only on click.

4) Passing Arguments in Event Handlers

- Use arrow function when passing custom values.

COLLEGE CODERS

Example:

```
<button onClick={()=>handleClick("Rohith")}>Click</button>
```

Explanation:

- Arrow function prevents immediate execution.

5) onChange Event – Handling Input Typing

- onChange captures input value while typing.

Example:

```
<input onChange={(e)=>setName(e.target.value)} />
```

Explanation:

- Each typed character updates state.

6) onSubmit Event – Handling Form Submission

- Used when form is submitted.

Example:

```
<form onSubmit={handleSubmit}>  
  <button>Submit</button>  
</form>
```

Explanation:

- Submit triggers handleSubmit.

7) Event Object (e)

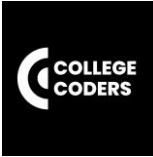

- Event object contains event information.

Example:

```
function handleSubmit(e){  
  e.preventDefault();  
  console.log(e.target.value);  
}
```

Explanation:

- preventDefault stops page refresh.

COLLEGE CODERS

- `e.target.value` reads input value.

8) Updating State Using Events

- Events often update state.

Example:

```
<button onClick={()=>setCount(count+1)}>Increase</button>
```

Explanation:

- Click changes state and UI updates.

9) Passing Functions as Event Handlers

- Pass function reference, not function call.

Example:

```
<button onClick={handleClick}>Click</button>
```

Explanation:

- Correct → function reference.
- Wrong → `onClick={handleClick()}`

Mini Project – Live Input + Counter

- Create input field showing typed text.
- Create counter button.
- Both should update using events.
